Binary tree

Version 1.0.0, by Giorgio Bianchini

Description: Opens a file containing one or more trees in binary format. Safe even when opening huge files.

Module type: FileType

Module ID: `8ccec519-3d83-4617-824f-dd474c88bdea`

This module adds support for the Binary tree file format (see this link for further information on this format).

To avoid memory overflow issues, the module does not read all the trees from the file into memory at once; instead, it only reads them one at a time when requested by the chosen Load file module.

This module is capable of reading information about TreeViewer modules stored in the tree file alongside the tree(s). This can be used to reproduce the tree plot as it was saved.
